GREASE INTERCEPTORS FOR HEALTHCARE FACILITIES

Highland Tank has provided grease interceptors for many health care projects. Food service within healthcare facilities plays a crucial role in patient well being and recovery as well as feeding employees and visitors. Plumbing codes state grease interceptors shall be provided to prevent the discharge of fats, oils, grease, and solids harmful to the public sewer, private sewage system, or sewage treatment plant or processes.

Our automatic grease interceptors are point-source interceptors that are designed to be installed indoors and typically under sinks in the kitchen. Automatic grease interceptors offer maintenance benefits to

hospitals and other facilities by allowing each individual cafeteria or restaurant to have a single grease removal and collection device.

Highland Tank's passive grease interceptors provide larger capacity and are installed outside, in a basement, or parking garage to handle larger volumes of fats, oils, grease, and solids. Both types of grease interceptors protect the facility's plumbing and reduce the risk of sewer backups.

Highland Tank excels at providing engineering support to accommodate challenging factors such as deep burials, servicing, installation, remote pump out,

and more. Reach out to us to discuss your grease interceptor projects.
